

 Delta SUPPORT GRID Screens

BUILT TO CARRY THE LOAD.

Frequently used in down flow vessels, support grids are flat screens that are used to support filter media. At Delta Screens, we can manufacture support grids in the material, size and shape you need as well as the exact specification your situation requires. We can also create support grids as a single form, or multiple piece installation.

Precisely welded for maximum strength and longevity, you can expect a Delta Screens support grid to resist buckling and collapse. Best of all, because they are a continuous slot screen, you won't need to use an intermediate layer of inert media. Plus, the design resists plugging and offers easy maintenance.
